

LinearDynamics Rook enables automated Milestone XProtect exports using Rimage hardware

Ottawa, Canada - May 2017 - LinearDynamics Rook software enables users of Milestone XProtect[®] to create automated, long-term to permanent export strategies. This extraordinarily tight integration promises to bring ease of use and implementation when performing large-scale exports of the Milestone XProtect database.

Long-term storage goals achieved

Thanks to Milestone's Open Platform and Rimage's powerful hardware, long-term optical archiving is easily within reach.

By merging the Rimage Catalyst[™] 6000N disc publishing system and LinearDynamics Rook software, Milestone XProtect[®] Management Client administrators of nearly any edition of XProtect can now sculpt and define archiving strategies which suit their needs. The new integration is capable of bulk exports of the XProtect database, but can also strongly focus on evidentiary exports for the concerned investigator.

LinearDynamics Rook possesses a great deal of flexibility when it comes to deciding what data needs to be exported, when it needs to get exported, and in what formats. Bookmarks, evidence locks, or sequences can be targeted for exporting. Exported data discs are fully searchable from a standardized database utility, ensuring that at no point would proprietary software or utilities be needed in order to explore the export.

Supported Milestone XProtect editions include:

Corporate	Professional
Expert	Express
Enterprise	Husky M30, M50

Export types and formats include:

Bookmarks, Evidence Locks, Sequences
AVI, MKV, JPG, and Milestone's own portable Smart Client format.

Optical media is ideal for long-term storage, and WORM (Write Once Read Many) technology ensures the data is tamperproof. Combining the power of Rook from LinearDynamics with disc publishing systems from Rimage, Milestone XProtect users now have long-term archiving capabilities not seen before.

Milestone XProtect Automated Exporting

Complete Solution

LinearDynamics
RIMAGE®

Automated Intelligence

- Specialized software connects to your XProtect Servers
- You create a ruleset
- Content is extracted based on your ruleset and schedule
- Content is sent to Rimage Catalyst 6000N
